

Peter Asanov

SENIOR SOFTWARE ENGINEER

Amsterdam, Netherlands

☎ +31629598355 ✉ ink.splatters@pm.me 🌐 github.com/ink-splatters 🌐 Peter Asanov

About

High-impact professional with 20 years' experience, spent over a decade building enterprise-grade distributed systems for real-time interactive and mission-critical applications, navigating complex problems and delivering elegant solutions.

Education

B.Sc. in Computer Science and Engineering

Novosibirsk, Russia

NOVOSIBIRSK STATE TECHNICAL UNIVERSITY (NSTU)

2002 - 2007

Skills

Distributed Systems systems design, scalability, HA, fault tolerance, consensus protocols (Paxos, Raft), CAP Trade-offs, event-driven systems

Dev stacks

Go gin, zap/slog, gomock

JS/TypeScript React, Auth.js, tRPC, Prisma, Vite, Tailwind CSS, Axios

Python FastAPI, mangum, uvicorn, SQLAlchemy, celery, dramatiq, pytest/pytest-mock, numpy, pandas, polars, PySpark, seaborn, pyo3/maturin

C++23 boost, flatbuffers, cap'n'proto

Rust tokio, Hyper, Request, clap

JVM Java, Kotlin, Spring / Boot, Hibernate, NIO

Build Systems Nix, CMake, ninja, Maven, Meson, Bazel

Cloud Native

IAM/IdPs AAD(enterprise), RBAC (Azure), KMS (AWS & GCP), Cognito, Auth0

Kubernetes Kubernetes (AKS / EKS / GKE), GCE

Other compute Azure VM, ECS, EC2

Serverless Azure Functions, AWS Lambda, GCF, CloudFlare workers

IaC Terraform, Bicep, Azure Templates, Cloud Formation, cdk

CI/CD & GitOps GitHub Actions, GitLab CI/CD, ArgoCD, Azure DevOps

Observability Azure Monitor / App Insights, AWS CloudWatch / X-Ray / CloudTrail, Prometheus, Grafana LGTM, OTLP

DevSecOps Continuous Security, OWASP Top-10, Secure-by-Design, Zero Trust, PoLP, RBAC, Tenant Isolation, Intrusion Detection

Data Systems

DBMS PostgreSQL, MySQL, Cassandra, MongoDB, QuestDB, CosmosDB, RDS, DynamoDB, GCS, CloudSQL

KV-store / caching etcd, Redis, RocksDB, Valkey, Memcached

Block storage S3 / Minio, ABS

Queueing RabbitMQ, ActiveMQ, Kafka

Big Data Apache Spark, FLiP (Flink + NiFi + Pulsar), Kafka (Streaming), Airflow, DuckDB

Crypto

PKI, Hashes, Symmetric (block) ciphers, KDFs, ECC / Curve25519, ECDH, EdDSA, Ristretto

Work Experience

Senior Software Engineer | Partner Integrations

Amsterdam, The Netherlands

Vox AI

July 2025 - Oct 2025

Given fast-paced startup environment and reporting directly to key stateholders, worked on bits of critical backend infrastructure for pioneers of accurate, fast, and reliable voice technology for drive-thrus.

1. Bidirectional integration with multi-channel order management platform as service provider (DSP) for menu ingestion and order processing workflows.

Owned (designed and shipped) AWS-backed multi-tenant event-driven serverless infrastructure (IaC), with strong focus on correctness, reproducible deployments and rich observability, facilitating shortest incident response times; supporting:

- fully managed OAuth2.0 server for partners onboarding and authorization
- menu ingestion and storage
- event driven substrate for orders handling
- workarounds for issues on partners' side like transformers handling RFC 6749 non-compliant OAuth2.0 client

2. POS menu mappers to in-house menu formats: tree based and flat (RAG-friendly, deduplication-focused).

Built sophisticated algorithmic transforms that handled ambiguous data structures, poor data quality (e.g. flattened graphs with invalid IDs, orphaned references) and canonicalization (e.g. rerooting/rearrangement of item modifiers).

Platform: AWS Lambda / Step Functions, SQS, DynamoDB, S3, Cognito IdP and authorizers, API Gateway, moto/uvicorn (local mocking)

Tools: cdk, TypeScript, Python 3.12+, mangum, uv, ruff, ty, pytest, pytest-mock, go (sidecar)

Achievements:

- via sophisticated algorithmic approaches, removed the large portion of headaches and need for hackwork when menus change
- shipped zero-to-one, business critical infrastructure and implemented large portion of business logic for industry-grade multi-tenant distributed system handling partner integrations with direct and immediate business impact
- delivered high-quality industry grade solutions under pressure and managing stakeholders' expectations

Senior Software Engineer

Netherlands

FREELANCE / CONTRACTING

2022 -

Worked on multiple projects as contractor/freelancer, with strong focus on platform engineering and cloud infrastructure:

- Deliverect, full cycle restaurant business automation PaaS: integrated extra dimensions to Ordering facility

Tools: Python, Eve, celery, Kubernetes (GKE), Typescript, React, Redis, minio (local backend)

- Ahold Delhaize (Albert Heijn): online data ingestion platform for internal compliance project, related to R&D efficiency and performance

Tools: Go, Kubernetes (AKS), Kafka Strimzi operator, GitOps (ArgoCD), Terraform

- Private customer: online data ingestion of Taxi terminals data for compliance project to prevent fraud from a driver side

Tools: Go, Kubernetes (AKS), Kafka, Postgres

- LEGO: building internal IAM / IdP functionality

Tools: Azure Functions, Azure SAML identity provider, Python

- Private customer: cloud based video conversion service

Tools: c++20, cmake, ninja, go, grpc-gateway, ffmpeg, nix, terraform(terrannix), EKS, CloudWatch

- Private customer: custom video calls service

Tools: c++23, cmake, ninja, asio, libdatachannel (WebRTC stack), nix, ansible

- Petproject [in development]: Pluggable and configurable HFT matching engine with focus on high performance / ultra-lowlatency. Possible applications: high volume / low latency crypto exchanges, arbitrage bots.

Tools: c++23 with extensive usage of SIMD intrinsics, Cap'n Proto, go

Core Software Engineer

Haarlem, Netherlands

AIMMS B.V.

Nov 2019 – Sep 2021

- Centric role in large cloud platform migration project (from AWS to Azure with substantial scratch-rewrite in modern c++, from former Java/Scala)
- Scratch-written Modern c++ framework and related micro-service template featuring protobuf DSL as API first class citizen, popularizing its use also for REST APIs to avoid buggy (back then) OpenAPI generators
- Bootstrapped Azure landing zone (custom bootstrap for Terraform state and RBAC)
- Built scalable tooling and participated in sensitive customer data migration
- Wrote low-code generator of CRUD apps from declarative schema, used for administrative and other internal tools; bringing measurable R&D cost reduction

Tools: ECS, EC2, CloudWatch, Go, Python, Java, Scala, c++17, Typescript, React, conan, cmake, ninja, grpc-gateway, go, Kubernetes (AKS), Azure Application Insights, Terraform

Achievements: tackled cost-efficiency and throughput predictability of compute-heavy optimization workloads (with non-deterministic convergence) by implementing Kubernetes-native solutions: bin packing via resource requests/limits and affinity rules, priority classes, and a pre-warmed spare node strategy using Cluster Autoscaler and taints/tolerations.

Senior Software Engineer

Amsterdam, Netherlands

HVR SOFTWARE (ACQUIRED BY FIVETRAN)

Jan 2018 – Oct 2019

Worked on high performance online data replication system, also called HVR (features and bugfixing)

- Worked on product core (log based replication engine)
- Reversed Oracle histogram data to build custom sharding functionality
- Built a Go REST service for cloud integration.

Tools: C99, Python, Go, multiple RDBMS and Big Data stacks (integration), Oracle (histogram internals), Airflow

Achievements: Rewrote a core feature flag transpiler used in HVR's CI/CD pipeline, cutting runtime from over 1 minute to 5 seconds.

This order-of-magnitude speedup on a critical build path significantly improved developer experience and delivered measurable infrastructure cost savings.

Software Engineer

Eindhoven, The Netherlands

MAPSCAPE B.V.

2017

Worked on Mapscape NDS (navigation data standard) compiler:

- implemented parts of NDS compiler backend related to parsing raw map data
- introduced parallelism in parsing raw map data, significantly speeding it up

Tools: c++ 11 / 14 / boost / gtest / sqlite / shell / python / Airflow

Senior Software Engineer

St. Petersburg, Russia

NEW CLOUD TECHNOLOGIES

2014 - 2017

My Office project: on-prem office solution featuring collaboration engine: work on core functionality (features and bugfixing) and on spreadsheets client for Tizen OS

Tools: c++14, cmake, emscripten, Objective C, Qt, SWIG, Kubernetes

Achievements:

- Independently built a cross-platform freetype-based font rendering engine with subpixel positioning for scalable document layouts; overcame technical depth and low project visibility to successfully drive integration into a large enterprise codebase.
- developed advanced spreadsheet UX for Samsung Tizen (embedded Linux), designing a declarative, compile-time state machine to avoid dynamic dispatch overhead and enable precise editing—resolving edge cases, free of bugs present back then in competitors' suites (e.g. Google Docs)

Senior Software Engineer

St. Petersburg, Russia

AIS

2014

Building bank (transaction facility) for crypto mining pool basic exchange functionality:

- scratch-written c++11 / asio framework and a few microservices (and their ownership)
- multi-stage fault tolerant transactions
- operating mission critical distributed system and managing risks of direct loss via using append-only fault-tolerant custom storage, two-factor transactions, impenitent circuit breaking, proper alerting, extensive testing
- zero-to-one release the thing into production as joint effort of 3 engineers exercising high degree of code ownership (on subsystem level)

Tools: c++11, Core Java, Groovy, Ruby(Chef)

Achievements:

- designed and implemented all C++11 microservices for crypto exchange banking facility, including a multi-stage, fault-tolerant transaction system and circuit breaker with (semi-)automatic rollbacks.
- delivered under pressure, a zero-to-one production launch in under 2 months alongside with one more person (Java developer), with personal accountability driving rigorous testing and system reliability under financial risk.
